

Mnemo Pipeline Test Paper

A Deterministic Fixture for End-to-End CI

Abstract

This synthetic paper exists solely to exercise the real paper-processing chain inside continuous integration. It contains extractable text, several headings, and a figure caption so that PDF parsing, section splitting, and figure extraction all produce genuine non-empty output.

1 Introduction

Knowledge accumulates when raw material is turned into structured notes. The pipeline under test downloads a source, parses it, splits it into sections, extracts figures, and finally drafts and reviews notes.

2 Method

Each step communicates with the next purely through JSON and Markdown files on disk. Steps are idempotent: an unchanged input fingerprint is skipped. Failure of one job never affects another, giving strong fault isolation.

Figure 1: Overview of the Mnemo processing pipeline.

3 Conclusion

This fixture confirms that the directed acyclic graph, the worker loop, and the individual step scripts remain correctly wired end to end.
